Data Science & Strategic Analytics
Graduate Symposium May 2026

To ensure policy considers the environment when analyzing paths to food access, this basemap shows valuable green spaces. Some of these spaces are currently slotted for development. Will the current transit paths provide quality access to the growing elderly population?

This bivariate map combining two variables: Swamp Ratio (purple axis) is the number of convenience stores to supermarkets. Blood Pressure Crude Rate (tan/beige axis) is a public health metric for hypertension prevalence. Areas that are dark red have both a high swamp ratio and high blood pressure rates, includes the 08087. The purple area (upper right) likely indicates high swamp ratio but lower blood pressure rates.

This GTFS transit buffer map also provides the stops for the OC6 line. A partial foodbank list is visible here alongside supermarkets. The OC6 line is not readily available on the GTFS API.
